Department of Civil Engineering

Brief report of Bore Well Recharge through rain Water harvesting-

Recharge through recharge wells can serve two very important purposes: first to control and mitigate flooding and secondly to help ensure rainwater percolates into groundwater. Groundwater recharge can be achieved through multiple "artificial recharge structures" such as recharge wells, direct borewell recharge, check dams (found in the rural context) etc. However this guide will focus on the "recharge well" as it is most appropriate in the urban context, consumes little real estate and can be retrofitted or integrated into real estate development.

In campus sufficient quantity of waste water is available for recharging wells. If we wouldn't do so it will go waste in drainage nala. To avoid this harvested rain water has been recharged to bore well.
